determine the deformation of the ceramics, as can be seen in Figs. 1 and 2. Here, III, IVa and b, and V show the highest softening temperatures and greatest bending strength at temperatures $> 1500^{\circ}\text{C}$. Despite the good strength and refractory qualities of V, this material cannot be used for any length of time in vacuo due to its excessive loss of weight. IVa and b ceramics evaporate least of all at $> 2000^{\circ}\text{C}$, but have very poor thermal stability. Materials I and II are equally valuable for their refractory and mechanical properties at high temperatures. Orig. art. has: 7 tables and 7 figures.

TITLE: Evaporation of porous oxide ceramics at elevated temperatures

SOURCE: Ogneupory, no. 11, 1966, 33-37

TOPIC TAGS: oxide ceramic, porous foam, ceramic, refractory product, evaporation, porosity

ABSTRACT: The thermomechanical and thermophysical properties of refractory porous oxide ceramics have been previously investigated (Guzman, I. Ya. Zhurnal VKhO im. D. I. Mendeleyeva, 1965, t. 10, no. 5, s. 57) but the suitability of these ceramics as heat insulating materials for equipment with a high vacuum or with a neutral gaseous medium is also limited by evaporation, on which no information has previously been available. To fill this gap, specimens of Al_2O_3 , ZrO_2 , BeO and MgO ceramics with typical values of porosity, prepared both by the foam method and by the method of burnout of additives, were tested for evaporation rate in

Card 1/3

UDC: 666.764

ACC NR: AP7005512

vacuum and in a helium atmosphere at 2073-2573°K by the method described by Lukin and Poluboyarinov (Ogneupory, 1964, no. 9, s. 418) for solid ceramics (since evaporation in porous bodies is difficult to determine, in this case conditional rate of evaporation, i.e. loss of weight per unit time per unit surface determined according to external dimensions of the specimen was used as the yardstick). Findings: given equal porosity, foam ceramics have a higher apparent porosity, a much lower gas permeability and smaller unit surface area than the ceramics prepared by the method of burnout of additives. The ratio K of effective surface area S_{eff} to total S_{total} , which also includes the surface area of isolated pores, represents the part of surface area of pores from which evaporation occurs: $K = S_{eff}/S_t$. In this connection, on the basis of the obtained findings and their comparison with data on the evaporation of solid sintered specimens, empirical equations are derived for calculating the evaporation of porous pure-oxide ceramics without resorting to intricate experiments. Thus the evaporation rate of a ceramic of any porosity can be determined from the relation $G = \Delta g/S_{eff}^2 t$, where Δg is the weight loss of the specimen, g; S_{eff} is the effective surface area, cm^2 ; t is the time of evaporation, sec. The higher the porosity and hence also the higher S_{eff} is, the greater the weight loss Δg must be. A comparison of experimental and theoretical findings on specimens of

Card 2/3

ACC NR: AP70055L2

varying porosity shows that K is constant for all types of ceramics and depends only on the method of their fabrication, which determines the nature of their structure. Orig. art. has: 2 figures, 3 tables.

TITLE: An Investigation of the Distortion Produced in Nuclear Emulsions by the Introduction of Threads into Them.
(Issledovaniye iskazheniy v yadernykh emul'siyakh, vnosi-mykh utoplennymi nityami)

PERIODICAL: Pribory i Tekhnika Eksperimenta, 1957, No.4,
pp. 27 - 29 (USSR).

ABSTRACT: There are a number of methods of introducing a material into an emulsion: 1) The emulsion may be loaded with the material in the form of a suspension when still in the liquid state (Ref.1). 2) A thin foil can be placed between prepared emulsion layers (Ref.2). 3) Thin metallic threads can be placed into the emulsion when it is still in the liquid state (Ref.3 and 4). The present work is devoted to the determination of distortions introduced into emulsions by the inclusion of thin metallic threads or filaments. 660 ± 5 MeV protons were used to irradiate emulsions with and without metallic threads and the distortion was determined by comparing the scattering of these protons in the two kinds of emulsion. At the same time, the "scattering constant" for the emulsion NIKFI (type P) which was used in the above work was also determined. This was

TITLE: Study of the energy spectrum of recoil nucleons

SOURCE: Akademiya nauk Kazakhskoy SSR. Institut yadernoy fiziki.
Trudy. v. 3, 1960. Vzaimodeystviye vysokoenergichnykh
chastits s atomnymi yadrami, 17-45

TEXT: Some theories concerning the energy distribution of recoil nucleons in the fission of emulsion nuclei by cosmic rays are discussed: evaporation theory, Serber-Goldberger model (calculation of the nucleon cascade inside the nucleus by the Monte-Carlo method), application of Messel's theory to cascades inside the nucleus, theories of multiple production of mesons and formation of low-energy particles in nucleon-nucleus collision. Theoretical and experimental investigations of energy spectra of recoil nucleons in the fission of tungsten, aluminum, and emulsion nuclei by cosmic rays, conducted by the author and other researchers in the range of 10^9 - 10^{10} ev and more, yielded the following results: In the fission of aluminum and tungsten nuclei, the energy spectra of the recoil protons are

Card 1/3

S/707/60/003/000/002/013

B117/B102

Study of the energy spectrum ...

different. In the former case, the mean energy of secondary protons which leave gray traces in the emulsion is higher than in the fission of tungsten. The result is in qualitative agreement with the concept of nucleon cascades inside the nucleus. Quantitative calculation of the number of cascades by the Monte-Carlo method (Serber-Goldberger model) yields a higher amount than the experiment. Study of secondary particles from stars produced by primary nucleons with energies above 10^{10} ev showed qualitative agreement of the experimental data with the concept of the cascade process caused in the nucleus by a primary particle. The experimentally found energy carried off by particles leaving black and gray traces proved to be smaller than the energy determined by Messel's theory of multiple production of mesons. Zh. S. Takibayev, Academician AS Kazakhskaya SSR, is thanked for attention, and Z. V. Anzon and N. P. Pavlova, laboratory assistants, for assisting with measurements. I. Ya. Pomeranchuk, L. D. Landau, A. P. ABSTRACT: The paper describes the design and experimental study of the efficiency of a large-area spark chamber operating simultaneously with an ionization calorimeter and photoemulsions. An analysis of the operating conditions produces the optimum values of parameters (including pulse voltage, pulse delay, and gap size) for the 23x30 cm² spark counter under consideration. Results show that 1) the counter efficiency does not depend on the electric field intensity alone, but also on other design parameters; and 2) a 23x30 cm² spark counter with a 1.5 mm gap can be used successfully in conjunction with ionization calorimeters for the study of high energy cosmic rays. TITLE: Fluctuation in the number of particles in an electromagnetic shower at 110 BeV /Report, All-Union Conference on Cosmic Ray Physics held at Apatity 24-31 August 1964/

SOURCE: AN SSSR. Izvestiya. Seriya fizicheskaya, v. 29, no. 9, 1965, 1719-1721

TOPIC TAGS: secondary cosmic ray, cosmic ray shower, electron, photon, iron

ABSTRACT: Electron-photon showers were investigated in an ionization calorimeter consisting of the following components in order from the top: 13 cm C, 3 cm Fe, 8 trays of ionization chambers each followed by 5 cm Fe, 2 trays of chambers with no absorber between, 1 cm Fe, 160 g/cm² C, 3 cm Pb, and two trays of chambers separated and followed by 2 cm Pb. Showers initiated by cosmic ray particles were regarded as electron-photon showers if they produced ionization in at least one of the two uppermost trays and no ionization in the two trays beneath the large carbon absorber. Of 334 electron-photon showers thus identified, 152 had energies between 100 and 200 BeV. The ionization versus depth curves for these showers were normalized to a primary energy of 110

Card 1/2

09013367

L 27897-66

ACC NR: AP5024642

BeV and averaged, and the average curve was compared with theoretical curves calculated for different assumed values of the radiation length in iron. Good agreement was obtained with the curve based on a radiation length of 12.6 g/cm². This value of the radiation length in iron was confirmed by comparing the observed depth of maximum shower development with calculated values. The fluctuation (ratio of the mean square to the square of the mean) in the number of particles in the showers as a function of depth was compared with the calculated curve of N.M.Gerasimova (Zh. eksperim. i teor. fiz., 43, 500 (1962); 44, 240 (1963)). Good agreement was found at depths less than 23 radiation units, but at greater depths the observed fluctuations were much less than the calculated ones. In conclusion, the authors express their gratitude to Zh.S. Takibayev for valuable discussions. Orig. art. has: 1 formula, 3 figures, and 1 table.

TITLE: Probability of the recording of "Stars" by an ionization
calorimeter [Paper presented at the All-Union Conference on Cosmic
Radiation Physics, Moscow, 15-20 Nov 1965]

SOURCE: AN SSSR. Izvestiya. Seriya fizicheskaya, v. 30, no. 10,
1966, 1602-1603

TOPIC TAGS: calorimeter, astrophysics, star, neutron, proton, alpha
particle, deuteron

SUB CODE: 08

ABSTRACT: Upon interaction of nucleus-reactive particles with matter, there
is not only formation of new particles but also fission of nuclei of the target,
which is accompanied by the emission of low-energy neutrons, protons, deute-
rons, and α - particles: i. e., formation of so-called "stars." The ioniza-
tion produced by strongly ionizing particles of the stars is added to that due
to electrons of the shower and measured, together with the latter, in an ioni-
zation calorimeter. On the basis of experimental data obtained on an instrument
of the ionization calorimeter type, in which iron was used as an absorber, the
contribution of stars to ionization was estimated at $\sim 10\%$ of the ionization
due to the nuclear shower. Orig. art. has: 2 figures and 3 formulas. JPRS:

TITLE: An electrical liquid level indicator type
yy K 3K-56(UUZhEK-56)

PERIODICAL: Promyshlennaya energetika, 1960, No. 1, pp. 30-31

TEXT: Hitherto the liquid level in tanks has been measured by methods using floats, for example in combination with selsyns. These devices have a fairly complicated mechanical transmission, they are not very accurate and require a considerable number of cable cores. An electric indicator of liquid level type UUZhEK-56 is now being used which does not suffer from these defects. It is intended for remote measurement of the level of water, crude oil, fuel oil, diesel fuel and lubricant in tanks. The electrical pick-up responds to hydrostatic pressure by altering in resistance. The pressure of the liquid flexes a membrane. The resulting change in resistance alters the current flowing in the bridge network of the measuring device so that the instrument pointer is deflected by an angle which is proportional to the change in pressure. The instrument is designed for supply at 24 V, d.c. or a.c. and takes

a current of 100 mA. The main error of the instrument over the temperature range +20 to +5°C does not exceed \pm 4% of the maximum reading. The pressure sensitive element weighs 2.8 kg and the measuring device 1.1 kg. Instruments are made for the ranges 0-3 up to 0-10 metres of water. These instruments are now in mass production and are widely used in the shipbuilding industry. There are 3 figures, 1 table and 1 Soviet reference.

PERIODICAL: Priroda, 1958, Nr 8, pp 117-118 (USSR)

ABSTRACT: A grandiose aurora borealis was seen far down into southern regions in the Soviet Union during the night from 10 to 11 February 1958. The southernmost point at which it was seen was the town of Genichesk at 46° north latitude. The aurora was accompanied by a heavy magnetic storm. The normal condition of the F₂ layer was disrupted and E layers became sporadically clearly marked at an altitude^s of 60 km. Among many watchers of the phenomenon was the deputy director of the Pechora - Ilych State Natural Preserve, Candidate of Biological Sciences O. Semenov-Tyan-Shanskiy.

SOURCE: Geomagnetizm i aeronomiya, v. 6, no. 2, 1966, 312-321

TOPIC TAGS: aurora, magnetic field, magnetic field interference

ABSTRACT: The distribution of the frequency of the appearance of auroras at the zenith in relation to latitude for magnetically quiet and magnetically disturbed periods is derived on the basis of observational evidence from a network of cameras covering the entire sky during the years 1957 — 1959 and 1963 — 1965. The position of the zone of polar auroras on the night and day sides of the earth during magnetically quiet and magnetically disturbed periods is obtained and the presence of a noticeable asymmetry for both periods is shown. The cyclic changes in the frequency of the appearance of auroras during the night hours are discussed. The latitudinal distribution of the mean diurnal values of the frequency of appearance of polar auroras is derived. It is shown that the ratio between ΔT_{hor} at the stations Tromso, Norway, and Tikhaya, and also the distribution of magnetic activity at Canadian stations,

TITLE: Auroras in the period of minimum solar activity cycle

SOURCE: Geomagnetizm i aeronomiya, v. 7, no. 1, 1967, 177-179

TOPIC TAGS: auroral property, solar activity, ~~appearance frequency~~, auroral zone, geomagnetic latitude, geomagnetic field, aurora, solar cycle, astromonic observatory

ABSTRACT: The frequency of occurrence and other properties of auroras during the minimum solar activity are investigated using photographs obtained during the IGYQS. The latitudinal distribution of the frequency of occurrence of auroras during the period from 1963 to 1965 is presented graphically for the winter months. Observation data obtained at Dixon and Chelyuskin stations shows that auroras occurring at midnight are observed in the northern sky and south of the zenith, respectively. The oval auroral zone observed at night was located between 69° and 70° northern geomagnetic latitude. Auroras were observed

Card 1/2

UDC: 550.388.8

ACC NR:AP7007830

within the oval auroral zone regardless of the decrease of solar activity. The central line of the zone at night observed during the solar activity minimum was shifted toward the pole. At night, the oval zone was located between 68° and 71° geomagnetic latitude. The diurnal variation in the frequency of occurrence of auroras has one maximum at midnight at geomagnetic latitudes less than 68° and two maxima at midnight at 71° latitude. The observed maxima were attributed to the asymmetry of the auroral zone, which is nearer to the pole during the morning and evening than at midnight. The change of the position of the oval auroral zone in the IGY and the IGYQS was the same. Azimuths of stretched auroras changed markedly during the IGY as well as in the diurnal and yearly periods. Orig. art. has: 3 figures.

✓ Influence of titanium dioxide on process of clinker formation. S. M. Royak, O. M. Astrceva, and M. N. Lukina, Tsvetnaya Metallurgiya 21, No. 3, 12-14 (1955). In the presence of TiO₂, there is rapid decompa. of CaCO₃, but slight formation of clinker minerals resulting in as high as 30-37% free CaO. With formation of a liquid phase, TiO₂ dissolves and dilutes it; this causes rapid assimilation of CaO, and free CaO drops to 4% and even to 1%. Clinkers contg. TiO₂ are characterized by formation of larger crystals of minerals, particularly alite (120 μ). B. Z. Kamich.

GOST-Standards 5382-50 (K peresmotru GOST 5382-50)

PERIODICAL: Standartizatsiya, 1958, Nr 4, pp 73 - 75 (USSR)

ABSTRACT: The revision of existing standards for methods of chemical analyses of Portland cements was necessary in order to include into the standards classical methods of analysis specified in practical use as well as new speed-up methods, such as trilonometric determination of magnesium oxide and photocolorimetric determination of ferric and manganese oxide. The proposed modifications and additions to classical methods will provide data of higher accuracy relating to the chemical composition of Portland cements. The new speed-up methods will enable cement workers to control and evaluate rapidly the yield quality.

10

Synthesis of hydrocarbons of the cyclobutane series. B. A. Kazanskii and M. Yu. Lukina. *Doklady Akad. Nauk. S.S.R.* 65, 683-6 (1949). — $\text{ClCH}_2\text{CHMeCH}_2\text{Br}$ (from $\text{CH}_2=\text{CMCH}_2\text{Cl}$ and HBr , with H_2O) with excess $\text{CH}_2=\text{CHCO}_2\text{Et}$, and Na gave 70% di-Et (3-chlorobutyl)-malonate, which, cyclized via the Na deriv., gave (3-Et, di-Et

1-methyl)-3,3-cyclobutanecarboxylate, saponified by alk. KOH to 97-98% free acid, which was decarboxylated at 210°, yielding 95% 1-methyl-3-cyclobutanecarboxylic acid (I). Passage of vapors of I and HCO_2H over MnO at 300° gave hydrazone, which was decompr. by the Kishner procedure to 1,3-dimethylcyclobutane; *trans*-isomer, $\text{b.p. } 57.4-7.0^\circ$, $n_D^{20} 1.3890$, $d_4^{20} 0.7016$, and *cis*-isomer, $\text{b.p. } 60.5-60.6^\circ$, $n_D^{20} 1.3833$, $d_4^{20} 0.7101$. AcOH in the above synthesis gave 70-55% 1-methyl-3-ethylcyclobutane, which yielded, by the above scheme, 1-methyl-3-ethylcyclobutane; *trans*-isomer, $\text{b.p. } 87.0-8.1^\circ$, $n_D^{20} 1.4005$, $d_4^{20} 0.7224$, and *cis*-isomer, $\text{b.p. } 91.0-9.1^\circ$, $n_D^{20} 1.4013$, $d_4^{20} 0.7310$. In the prepn. of the aldehyde from I, a small amt. of bis(3-methylcyclobutyl)ketone always formed; it was also obtained from I over MnO_2 (NaHSO_3 adduct); its hydrazone yielded bis(3-methyl-1-butyl)methane as a stereoisomeric mixt., $\text{b.p. } 178-84^\circ$, $n_D^{20} 1.4402$, $d_4^{20} 0.8027$.

10

Catalytic ring-opening hydrogenation of hydrocarbons of the cyclobutane series. B. A. Kazanskil and M. Yu. Lukina. *Doklady Akad. Nauk S.S.R.* 74, 263-6 (1950).
On 10 ml. (3.05 g.) of a platinized C catalyst, at a space velocity of about 0.25 l./l. catalyst/hr., with H₂ passing at the approx. rate of 1 l./hr., hydrogenolysis of ethylcyclobutane (I) began at about 150°; at 250°, the ring is opened to the extent of 89%. With 1,3-dimethylcyclobutane, at 200°, ring opening attains 28%, and at 250°, 90%. With 1-methyl-3-ethylcyclobutane the extent of the reaction at 225° is 70-80%. Under the same conditions, at 250°, the cyclopentane ring is opened and hydrogenated only to the extent of 5%. By fractionation of the products of I, Et-CH₂Me and Me(CH₂)₂Me are produced in almost equal amounts, i.e. all C—C bonds in I are equiv. with regard to splitting, and the substituent exerts no orienting influence. Disubstitution, in the case of a 4-membered ring, has no inhibiting effect. N. Thou

Synthesis of 1-methyl-3-propylcyclobutane. B. A. Kazanskii and M. V. Lukina. Izv. Akad. Nauk S.S.R., Ser. Fiz. Khim., 1954, 17, 4. — To 31.5 g. 1-methyl-3-propylcyclobutane in 30 ml. EtOH was slowly added 32 g. 85% NaH. It was in 30 ml. EtOH, the mixt. refluxed 4 hrs., the solvent distil. (bath temp. 140°), and the cooled residue treated with some solid NaOH, yielding a layer of the hydrazone, b_{10}° 101-102°. This was pyrolyzed with solid KOH (heated in a Ag dish) and the distillate washed with H_2O , 60% H_2SO_4 , and aq. NaOH, giving 57.1% mixed *cis-trans* isomers of 1-methyl-3-propylcyclobutane. Fractionation gave the *trans*-isomer, b_{10}° 116.1-116.3°, n_D^{20} 1.4088, λ_{in} 0.3870, melting point 60.4°; and the *cis*-isomer, b_{10}° 118.5-8.7°, n_D^{20} 1.4124; d_4° 0.7453, melting point 37.2°. 1-Methyl-3-propylcyclobutane semicarbazone m.p. 130-132°.

✓ Synthesis and catalytic hydrogenolysis of 1,1,2-trimethylcyclopropane. B. A. Kuzanski, M. Yu. Lukin, and V. A. Ovodova (N. D. Zelinskii Inst. Org. Chem., Acad. Sci. U.S.S.R., Moscow). Izvest. Akad. Nauk S.S.R., Otdel. Khim. Nauk 1954, 879-81. — To 90.6 g. NH_2H_2O was added slowly 93.1 g. mesityl oxide, and the cooled mixt. treated with solid NaOH; distn. of the org. layer gave 60-70% b 3,5,5-trimethylpyrazoline, b. 158-60°. This (44.3 g.), 78.4 g. KOH, and 500 ml. triethylene glycol were slowly heated to 220-35°; at which temp. the reaction began with distn. of 1,1,2-trimethylcyclopropane, the reacting mass being kept at about 255-60°. After the usual washing and distn. there was obtained 41.7% 1,1,2-trimethylcyclopropane, b.p. 62.6°, d₄ 0.6648, n_D²⁰ 1.3862. This passed over Pt-C at 60° underwent complete cleavage to 2,2-dimethylbutane. The result is the same at 100°. G. M. Kosolapoff.

Authors : Alekseyan, V. T.; Lukina, M. Yu.; Sterin, Kh. Ye.; and Kazanskiy, B. A.

Title : Combined diffusion spectra of certain hydrocarbons of the cyclobutane series

Periodical : Izv. AN SSSR. Ser. fiz. 18/6, 699-702, Nov-Dec 1954

Abstract : The results obtained in studying the spectra of nine cyclobutane hydrocarbons are analyzed. An interpretation of the various frequencies and their forms (trans-cis, etc.) is given. Two references: 1 USA and 1 USSR (1943-1954). Table.

Institution : Acad. of Sc., USSR, The N. D. Zelinskiy Inst. of Organ. Chem. and the Commission on Spectroscopy

Synthesis of 1,2-dimethylcyclobutane. B. A. Kazanski¹ and M. Yu. Lukina (N. D. Zelinskii Inst. Org. Chem. Acad., Sci. U.S.S.R., Moscow). *Doklady Akad. Nauk S.S.R.* 94, 887-9 (1954).—Hydrolysis of di-Et 1-methylcyclobutane-2,2-dicarboxylate gave 80.5% 1-methylcyclobutane-2-carboxylic acid, b_{114} 199-203°, n_D^{20} 1.4402, d_4 1.0112. The acid chloride with PhNHNH₂ gave the anilide; m. 129.5-9.0° (from dil. EtOH). Passage of the mixt. of the acid and HCO₂H over MnO at 315° gave 59.8% 1-methylcyclobutane-2-carboxyaldehyde, b_{114} 122-6°, n_D^{20} 1.4298, d_2 0.8934; semicarbazone, m. 124.3-4.5°. Reduction of the hydrazone of the aldehyde according to Kishner's method gave 70.6% 1,2-dimethylcyclobutane. The *trans* isomer, b_m 56.8-6.9°, n_D^{20} 1.3393, d_4 0.7029, f.p. -122.5°, aniline point 52.0°, was sepd. by distn. The higher boiling fractions contained varying proportions of the *cis* isomer; these comprised only a small fraction of the total yield. The *cis* form is estd. to boil at 67-8°. G. M. Kosolapoff

Title : Catalytic hydrogenolysis of ethylcyclopropane and methylcyclobutane

Periodical : Dok. AN SSSR 97/4, 623-686, Aug 1, 1954

Abstract : Cyclopentane, methylcyclobutane and ethylcyclopropane were subjected to catalytic hydrogenation for the purpose of comparing the easiness of hydrogenolysis of three-, four- and five-membered hydrocarbon cycles. The break in the C-C bond for the three hydrocarbons was established at temperatures ranging from 50 to 250°. The trend in the rupture of the C-C bonds is distinguished by specific characteristics, which are explained in chemical formulas. Nineteen references: 10-USSR, 6-USA; 1-German; 1-English and 1-Dutch (1907-1953). Tables.

Lukina, M. Yu.

Catalytic hydrogenation of hydrocarbons of cyclopropane and cyclobutane series. B. A. Kazanski and M. Yu. Lukina (N. D. Zelinskii Inst. Org. Chem., Acad. Sci. U.S.S.R., Moscow). Kataliticheskoe Gidrolyzovaniye i Otsnezhenie, Trud. Nauk. Kazakh. S.S.R., Trudy Konf. 1955, 18-28. Hydrogenolysis over Pt-C at 250-300° of cyclopropane results in 3-63% rupture of the ring; at 250-60° 83-98% of methylcyclobutane is ruptured, and 100% of ethylcyclopropane is ruptured at 60-100°. At 225-50° 82-97% of ethylcyclobutane is ruptured; at 250° 95.6% of 1,3-dimethylcyclobutane is ruptured, at 225° 78% of 1-methyl-3-ethylicyclobutane is cleaved, and at 60° 100% of 1,1,2-trimethylcyclopropane is cleaved. Methylcyclobutane is cleaved equally at all C-C bonds. Ethylcyclopropane gave 2-methylpentane and hexane; ethylcyclopropane gave 2-methylbutane; 1,1,2-trimethylcyclopropane gave 2,2-dimethylbutane. Thus the C₃ ring is ruptured only in 1 place with H addn. at the most hydrogenated C atoms. Cyclobutane homologs are cleaved at all possible points.

Title : Dehydration of dimethylcyclobutylcarbinol

Periodical : Dok. AN SSSR 101/4, 683-686, Apr 1, 1955

Abstract : Experimental data are presented on the derivation of two olefine hydrocarbons, with four-membered ring, through the dehydration of dimethylcyclobutylcarbinol in heated state and the addition of concentrated H_2SO_4 . The entire dehydration-synthesis process and the hydrocarbon yields obtained are described. The results obtained were compared with those of other previous attempts to synthesize four-membered olefines and the findings are listed. Title : Hydrogenation of isopropenylcyclopropane in the presence of Pd black

Periodical : Izv. AN SSSR, Otd. khim. nauk 1, 36-42, Jan 1956

Abstract : Experiments showed that the hydrogenation of isopropenylcyclopropane in an alcohol solution in the presence of Pd-black at room temperature and atmospheric pressure results in the addition of two hydrogen molecules to the propane and the formation of 2-methylpentane. It was found that the hydrogenation is followed by intermediate formation of 2-methylpenene-1 and 2-methylpentene-2. Isomerization of 2-methylpenetene-2 into 2-methylpentene-1 and vice versa was observed under conditions identical to those of hydrogenation. Continuous agitation with reduced Pd-black produced no effect on the isopropenylcyclopropane. Ten references; 5 Russ and USSR, 4 USA and 1 Germ. (1912-1954). Tables; graphs.
